# Instructions

A designer has given you the following mockup that you will be asked to turn into a working page on Shopify.com.
Keep in mind that it should work for everyone. Think mobile, cross-browser, etc.

1. The final result should live in a service like CodePen, JS Bin, etc.
2. Feel free to use any CSS preprocessor and JS Framework/Library. It's also fine to not use any of those.
3. When submitting the form
    a. If the email field does not validate, an error message should be rendered below the fields.
    b. If the email field is valid, the form should submit and log the value of each field in the browser console without refreshing the page.
4. The "Unsubscribe" link at the bottom does not have any actions.
